

SPECTRUM REPORT

Applicant: Dragino Technology Co., Limited

Address of Applicant: Room 202, Block B, BaoChengTai industrial park, No.8
CaiYunRoad LongCheng Street, LongGang District, Shenzhen
518116,China

Manufacturer/Factory: Dragino Technology Co., Limited

**Address of
Manufacturer/Factory:** Room 202, Block B, BaoChengTai industrial park, No.8
CaiYunRoad LongCheng Street, LongGang District, Shenzhen
518116,China

Equipment Under Test (EUT)

Product Name: LoRa IoT Gateway

Model No.: LG02, LG01-N

Applicable standards: ETSI EN 300 220-1 V3.1.1 (2017-02)
ETSI EN 300 220-2 V3.1.1 (2017-02)

Date of sample receipt: March 04, 2019

Date of Test: March 05-21, 2019

Date of report issue: March 22, 2019

Test Result : Pass *

*In the configuration tested, the EUT complied with the standards specified above.

The CE mark as shown below can be used, under the responsibility of the manufacturer, after completion of an EC Declaration of Conformity and compliance with all relevant EC Directives. The protection requirements with respect to electromagnetic compatibility contained in Directive 2014/53/EU are considered.

Robinson Lo

Laboratory Manager

This results shown in this test report refer only to the sample(s) tested, this test report cannot be reproduced, except in full, without prior written permission of the company. The report would be invalid without specific stamp of test institute and the signatures of compiler and approver.

4 Test Summary

Test item	ETSI EN 300 220-2	ETSI EN 300 220-1	Condition	Result
	Clause Number			
Operating Frequency	4.2.1	5.1.1		Pass
Unwanted emissions in the spurious domain	4.2.2	5.9.1		Pass
TX effective radiated power	4.3.1	5.2.1		Pass
TX Maximum e.r.p. spectral density	4.3.2	5.3.1	Applies to EUT using annex B bands 1, L. Applies to EUT using DSSS or wideband techniques other than FHSS modulation, using annex C band X.	N/A
TX Duty cycle	4.3.3	5.4.1	Not applicable to EUT with polite spectrum access where permitted in annex B. table B.1 or annex C, table .1 or any NRI.	Pass
TX Occupied bandwidth	4.3.4	5.6.1		Pass
Tx out of band emissions	4.3.5	5.8.1	Applies to EUT with OCW> 25 kHz.	Pass
TX Transient	4.3.6	5.10.1		Pass
TX Adjacent channel power	4.3.7	5.11.1	Applies to EUT with OCW<25kHz.	N/A
TX behaviour under low voltage conditions	4.3.8	5.12.1	Applies to battery powered EUT.	Pass
TX Adaptive power control	4.3.9	5.13.1	Applies to EUT with adaptive power control using annex C band AA.	N/A
TX FHSS	4.3.10	4.3.5	Applies to FHSS EUT.	Pass
TX Short term behaviour	4.3.11	5.5.1	Applies to EUT using annex C bands Y, Z,A, AB, AC, AD.	N/A
RX sensitivity	4.4.1	5.14.1	Applies to EUT with polite spectrum access.	N/A
Clear channel assessment threshold	4.5.2	5.21.2	Applies to EUT with polite spectrum access.	N/A
Polite spectrum access timing parameters	4.5.3	5.21.1	Applies to EUT with polite spectrum access.	N/A
RX Blocking	4.4.2	5.18.1		Pass
Adaptive Frequency Agility	4.5.4	5.21.4.1	Applies to EUT with AFA.	N/A

Remark:

Tx: In this whole report Tx (or tx) means Transmitter.

Rx: In this whole report Rx (or rx) means Receiver.

Temperature (Uncertainty): $\pm 1^{\circ}\text{C}$ Humidity(Uncertainty): $\pm 5\%$

EUT not support Polite spectrum access equipment.

5 General Information

5.1 General Description of EUT

Product Name:	LoRa IoT Gateway																
Model No.:	LG02, LG01-N																
Test Model No.:	LG02																
<p>Remark: All above models are identical in the same PCB layout and electrical circuits. The differences are shown in the table below:</p> <table border="1"> <thead> <tr> <th>Model name</th> <th>Module</th> <th>Antenna</th> </tr> </thead> <tbody> <tr> <td rowspan="3">LG02</td> <td>Module 1: 868MHz</td> <td>Antenna 1: 868MHz(TX)</td> </tr> <tr> <td>Module 2: 868MHz</td> <td>Antenna 2: 868MHz(RX)</td> </tr> <tr> <td>Module 3: WIFI 2.4G</td> <td>Antenna 3: WIFI 2.4G(TX/RX)</td> </tr> <tr> <td rowspan="2">LG01-N</td> <td>Module 1: 868MHz</td> <td>Antenna 1: 868MHz(TX/RX)</td> </tr> <tr> <td>Module 2: WIFI</td> <td>Antenna 2: WIFI 2.4G(TX/RX)</td> </tr> </tbody> </table>			Model name	Module	Antenna	LG02	Module 1: 868MHz	Antenna 1: 868MHz(TX)	Module 2: 868MHz	Antenna 2: 868MHz(RX)	Module 3: WIFI 2.4G	Antenna 3: WIFI 2.4G(TX/RX)	LG01-N	Module 1: 868MHz	Antenna 1: 868MHz(TX/RX)	Module 2: WIFI	Antenna 2: WIFI 2.4G(TX/RX)
Model name	Module	Antenna															
LG02	Module 1: 868MHz	Antenna 1: 868MHz(TX)															
	Module 2: 868MHz	Antenna 2: 868MHz(RX)															
	Module 3: WIFI 2.4G	Antenna 3: WIFI 2.4G(TX/RX)															
LG01-N	Module 1: 868MHz	Antenna 1: 868MHz(TX/RX)															
	Module 2: WIFI	Antenna 2: WIFI 2.4G(TX/RX)															
Operation Frequency:	863MHz~870MHz																
Channel numbers:	35																
Channel separation:	200kHz																
Occupied bandwidth	200kHz(Declared by manufacturer)																
Modulation type:	FSK																
Antenna type:	External antenna																
Antenna Gain:	3.35dBi(Declared by applicant)																
Power supply:	AC/DC ADAPTER Model:TP12-120100E Input: AC 100-240V, 50/60Hz, 0.5A Max Output: DC 12V, 1.0A																

Operation Frequency each of channel							
Channel	Frequency	Channel	Frequency	Channel	Frequency	Channel	Frequency
1	863.1MHz	10	864.9MHz	19	866.7MHz	28	868.5MHz
2	863.3MHz	11	865.1MHz	20	866.9MHz	29	868.7MHz
3	863.5MHz	12	865.3MHz	21	867.1MHz	30	868.9MHz
4	863.7MHz	13	865.5MHz	22	867.3MHz	31	869.1MHz
5	863.9MHz	14	865.7MHz	23	867.5MHz	32	869.3MHz
6	864.1MHz	15	865.9MHz	24	867.7MHz	33	869.5MHz
7	864.3MHz	16	866.1MHz	25	867.9MHz	34	869.7MHz
8	864.5MHz	17	866.3MHz	26	868.1MHz	35	869.9MHz
9	864.7MHz	18	866.5MHz	27	868.3MHz		

The test frequencies are below:

Channel	Frequency
The lowest channel	863.1MHz
The middle channel	866.5MHz
The Highest channel	869.9MHz

5.2 Test mode

Transmitting mode	Keep the EUT in continuously transmitting mode
Receiving mode	Keep the EUT in receiving mode

5.3 Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

- **FCC —Registration No.: 381383**

Global United Technology Services Co., Ltd., Shenzhen EMC Laboratory has been registered and fully described in a report filed with the (FCC) Federal Communications Commission. The acceptance letter from the FCC is maintained in files. Registration 381383.

- **Industry Canada (IC) —Registration No.: 9079A-2**

The 3m Semi-anechoic chamber of Global United Technology Services Co., Ltd. has been registered by Certification and Engineering Bureau of Industry Canada for radio equipment testing with Registration No.: 9079A-2.

- **NVLAP (LAB CODE:600179-0)**

Global United Technology Services Co., Ltd., is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP). LAB CODE:600179-0

5.4 Test Location

All tests were performed at:

Global United Technology Services Co., Ltd.

Address: No. 123-128, Tower A, Jinyuan Business Building, No.2, Laodong Industrial Zone, Xixiang Road, Baoan District, Shenzhen, Guangdong, China

Tel: 0755-27798480

Fax: 0755-27798960

7 Radio Technical Requirements Specification in ETSI EN 300 220-2

7.1 Test conditions

Normal conditions	Ambient:	Temperature.:	+15°C to +35°C
		relative humidity:	20 % to 75 %
	Power supply:	Battery:	Nominal
		AC mains source	Nominal
		Other power sources	Nominal
Extreme conditions	Ambient:	Temperature.:	-20°C to +55°C
	Power supply:	Battery:	0.9 and 1.3 multiplied for lead-acid battery 0.85 and 1.15 multiplied for "gel-cell" type batteries 0.85 and 0.9 multiplied for lithium and nickel-cadmium type batteries For other types it may be declared by manufacturer
		AC mains source	± 10% of the nominal power source
		Other power sources	Declared by manufacturer

7.2 Transmitter Requirement

7.2.1 Operation Frequency

The Operational Frequency band(863~870MHz) was declared by the manufacturer which conforms annexes B, C or any NRI of ETSI EN 300220-2.

7.2.2 Effective Radiated Power

Test Requirement:	ETSI EN 300 220-2 clause 4.3.1
Test Method:	ETSI EN 300 220-1 clause 5.2
Test site:	Measurement Distance: 3m (Semi-Anechoic Chamber)
Receiver setup:	RBW=120kHz, VBW=300kHz, Detector= peak
Limit:	25mW=14dBm (Refer to Annex B of ETSI EN 300220-2)
Test setup:	
Test procedure:	<p>Substitution method was performed to determine the actual ERP emission levels of the EUT.</p> <p>The following test procedure as below:</p> <ol style="list-style-type: none"> 1. On the test site as test setup graph above, the EUT shall be placed at the 1.5m support on the turntable and in the position closest to normal use as declared by the provider. 2. The test antenna shall be oriented initially for vertical polarization and shall be chosen to correspond to the frequency of the transmitter. The output of the test antenna shall be connected to the measuring receiver. 3. The transmitter shall be switched on, if possible, without modulation and the measuring receiver shall be tuned to the frequency of the transmitter under test. 4. The test antenna shall be raised and lowered from 1m to 4m until a maximum signal level is detected by the measuring receiver. Then the turntable should be rotated through 360° in the horizontal plane, until the maximum signal level is detected by the measuring receiver. 5. Repeat step 4 for test frequency with the test antenna polarized horizontally. 6. Remove the transmitter and replace it with a substitution antenna (the antenna should be half-wavelength for each frequency involved). The center of the substitution antenna should be approximately at the same location as the center of the transmitter. At the lower frequencies, where the substitution antenna is very long, this will be impossible to achieve when the antenna is polarized vertically. In such case the lower end of the antenna should be 0.3 m above the ground. 7. Feed the substitution antenna at the transmitter end with a signal generator connected to the antenna by means of a nonradiating cable.

	<p>With the antennas at both ends vertically polarized, and with the signal generator tuned to a particular test frequency, raise and lower the test antenna to obtain a maximum reading at the spectrum analyzer. Adjust the level of the signal generator output until the previously recorded maximum reading for this set of conditions is obtained. This should be done carefully repeating the adjustment of the test antenna and generator output.</p> <p>8. Repeat step 7 with both antennas horizontally polarized for each test frequency.</p> <p>9. Calculate power in dBm into a reference ideal half-wave dipole antenna by reducing the readings obtained in steps 7 and 8 by the power loss in the cable between the generator and the antenna, and further corrected for the gain of the substitution antenna used relative to an ideal half-wave dipole antenna by the following formula:</p> $\text{ERP(dBm)} = \text{Pg(dBm)} + \text{antenna gain (dBd)}$ <p>where:</p> <p>Pg is the generator output power into the substitution antenna.</p>
Measurement Record:	Uncertainty: $\pm 1.5\text{dB}$
Test Instruments:	Refer to section 6.0 for details
Test mode:	Refer to section 5.2 for details
Test results:	Pass

Measurement Data

Test conditions	Channel	ERP Level (dBm)	Limit (dBm)	Result
Normal	Lowest	10.25	14	Pass
	Middle	10.23		
	Highest	10.31		

Remark: Peak value is applicable.

7.2.3 Duty Cycle

Test Requirement:	ETSI EN 300 220-2 clause 4.3.3
Test Method:	ETSI EN 300 220-1 clause 5.4
Limit:	1%
Test setup:	 <p>The diagram illustrates the test setup. A Spectrum Analyzer is connected via a red cable to an E.U.T. (Equipment Under Test). Both are placed on a Non-Conducted Table. Below the table is a Ground Reference Plane.</p>
Test procedure:	<p>An assessment of the overall Duty Cycle shall be made for a representative period of Tobs over the observation bandwidth Fobs. Unless otherwise specified, Tobs is 1 hour and the observation bandwidth Fobs is the operational frequency band.</p> <p>The representative period shall be the most active one in normal use of the device. As a guide "Normal use" is considered as representing the behaviour of the device during transmission of 99 % of transmissions generated during its operational lifetime.</p> <p>Procedures such as setup, commissioning and maintenance are not considered part of normal operation.</p> <p>Where an acknowledgement is used, the additional transmitter on-time from a message responder shall be declared only once whether included in the message initiator Duty Cycle or in the message responder Duty Cycle.</p> <p>Center frequency: The nominal operating frequency RBW=100kHz VBW>=3*RBW Span=0 Hz Trace detector: Peak</p>
Test Instruments:	Refer to section 6.0 for details
Test mode:	Refer to section 5.2 for details
Result:	Pass

Measurement Data

Channel	Ton time(s)	Tcycle time(s)	Dutycycle	Limit	Result
Lowest	0.1	60	0.17%	1%	Pass
Highest	0.1	60	0.17%		Pass

7.2.4 Occupied Bandwidth

Test Requirement:	ETSI EN 300 220-2 clause 4.3.4																					
Test Method:	ETSI EN 300 220-1 clause 5.6																					
Receive setup:	<p style="text-align: center;">Table 12: Test Parameters for Max Occupied Bandwidth Measurement</p> <table border="1"> <thead> <tr> <th>Setting</th> <th>Value</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>Centre frequency</td> <td>The nominal Operating Frequency</td> <td>The highest or lowest Operating Frequency as declared by the manufacturer</td> </tr> <tr> <td>RBW</td> <td>1 % to 3 % of OCW without being below 100 Hz</td> <td></td> </tr> <tr> <td>VBW</td> <td>3 x RBW</td> <td>Nearest available analyser setting to 3 x RBW</td> </tr> <tr> <td>Span</td> <td>At least 2 x Operating Channel width</td> <td>Span should be large enough to include all major components of the signal and its side bands</td> </tr> <tr> <td>Detector Mode</td> <td>RMS</td> <td></td> </tr> <tr> <td>Trace</td> <td>Max hold</td> <td></td> </tr> </tbody> </table>	Setting	Value	Notes	Centre frequency	The nominal Operating Frequency	The highest or lowest Operating Frequency as declared by the manufacturer	RBW	1 % to 3 % of OCW without being below 100 Hz		VBW	3 x RBW	Nearest available analyser setting to 3 x RBW	Span	At least 2 x Operating Channel width	Span should be large enough to include all major components of the signal and its side bands	Detector Mode	RMS		Trace	Max hold	
Setting	Value	Notes																				
Centre frequency	The nominal Operating Frequency	The highest or lowest Operating Frequency as declared by the manufacturer																				
RBW	1 % to 3 % of OCW without being below 100 Hz																					
VBW	3 x RBW	Nearest available analyser setting to 3 x RBW																				
Span	At least 2 x Operating Channel width	Span should be large enough to include all major components of the signal and its side bands																				
Detector Mode	RMS																					
Trace	Max hold																					
Limit:	<p>The Operating Channel shall be declared and shall reside entirely within the Operational Frequency Band.</p> <p>The Maximum Occupied Bandwidth at 99 % shall reside entirely within the Operating Channel defined by F_{low} and F_{high}.</p> <p>Note: For 865 MHz to 868 MHz FHSS equipment. The Maximum occupied bandwidth per hopping channel shall be less or equal to 50kHz. For 863 MHz to 870 MHz FHSS equipment. The Maximum occupied bandwidth per hopping channel shall be less or equal to 100kHz.</p>																					
Test setup:	 <p>The diagram illustrates the test setup. A Spectrum Analyzer is connected via a red cable to an E.U.T. (Equipment Under Test). Both are placed on a Non-Conducted Table, which is supported by two vertical legs. Below the table is a Ground Reference Plane, represented by a thick grey bar.</p>																					
Test Procedure:	<p>Step 1: Operation of the EUT shall be started, on the highest operating frequency as declared by the manufacturer, with the appropriate test signal. The signal attenuation shall be adjusted to ensure that the signal power envelope is sufficiently above the noise floor of the analyser to avoid the noise signals on either side of the power envelope being included in the measurement.</p> <p>Step 2: When the trace is completed the peak value of the trace shall be located and the analyser marker placed on this peak.</p> <p>Step 3: The 99 % occupied bandwidth function of the spectrum analyser shall be used to measure the occupied bandwidth of the signal.</p>																					
Measurement Record:	Uncertainty: $\pm 5\%$																					
Test Instruments:	Refer to section 6.0 for details																					
Test mode:	Refer to section 5.2 for details																					
Test results:	Pass																					

Measurement Data

Remark:

Volt= Voltage, Temp= Temperature

7.2.5 Frequency Error

Test Requirement:	ETSI EN 300 220-2 clause 4.3.3
Test Method:	ETSI EN 300 220-1 clause 5.7
Test setup:	
Test Procedure:	<p>Step 1: Operation of the EUT shall be started on the nominal frequency as declared by the manufacturer under extreme high temperature and extreme voltage conditions. The frequency of the unmodulated carrier shall be measured and noted.</p> <p>Step 2: Operation of the EUT shall be started on the nominal frequency as declared by the manufacturer under extreme low temperature and extreme voltage conditions.</p>
Measurement Record:	Uncertainty: $\pm 0.5\text{ppm}$
Test Instruments:	Refer to section 6.0 for details
Test mode:	Refer to section 5.2 for details
Test results:	Pass

Measurement Data

Test conditions	Channel	Frequency(MHz)	A-N(KHz)	B-N(KHz)
N(NTNV)	Lowest	863.1MHz	0	0
	Highest	869.9 MHz	0	0
B(HTHV)	Lowest	863.1MHz	0	0
	Highest	869.9 MHz	0	0
A(LTLV)	Lowest	863.1MHz	0	0
	Highest	869.9 MHz	0	0

Remark:HTHV is the extreme high temperature and extreme voltage condition. LTLV is the extreme low temperature and extreme voltage condition.

7.2.6 TX Out Of Band Emissions

Test Requirement:	ETSI EN 300 220-2 clause 4.3.5																																																
Test Method:	ETSI EN 300 220-1 clause 5.8.3

7.2.8 Adjacent Channel Power

Test Requirement:	ETSI EN 300 220-2 Clause 4.3.7.2			
Test Method:	ETSI EN 300 220-1 Clause 5.11			
Limit:	Table 26: Adjacent channel power limits for transmitters with OCW ≤ 25 kHz			
			Adjacent Channel power integrated over 0,7 x OCW	Alternate Adjacent Channel power integrated over 0,7 x OCW
	OCW < 20 kHz	Normal test conditions	-20 dBm	-20 dBm
		Extreme test conditions	-15 dBm	-20 dBm
	OCW ≥ 20 kHz	Normal test conditions	-37 dBm	-40 dBm
Extreme test conditions		-32 dBm	-37 dBm	
Test procedure:	Center frequency: The nominal operating frequency RBW=100Hz VBW>=3*RBW Span:>=5*operating channel width Trace detector: RMS Trace mode: Max hold			
Measurement Record:	Uncertainty: ± 1.5dB			
Test Instruments:	Refer to section 6.0 for details			
Test mode:	Refer to section 5.2 for details			
Test results:	N/A (Not applicable for OCW ≥25KHz)			

7.2.9 Adaptive Power Control

Only used in 870,000 MHz to 875,800 MHz band equipment.

7.2.10 TX FHSS

Test Requirement:	ETSI EN 300 220-2 Clause 4.3.10												
Test Method:	ETSI EN 300 220-1 Clause 4.3.5												
Limit:	<p style="text-align: center;">Table 2: Number of Hop Channels</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Operational frequency band</th> <th style="text-align: center;">Number of hop channels</th> <th style="text-align: center;">Maximum occupied bandwidth per hopping channel</th> <th style="text-align: center;">Specific requirements</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">865 MHz to 868 MHz</td> <td style="text-align: center;">≥ 58</td> <td style="text-align: center;">≤ 50 kHz</td> <td style="text-align: center;">< 1 % TX duty cycle (see note)</td> </tr> <tr> <td style="text-align: center;">863 MHz to 870 MHz</td> <td style="text-align: center;">≥ 47</td> <td style="text-align: center;">≤ 100 kHz</td> <td style="text-align: center;">< 0,1 % TX duty cycle (see note)</td> </tr> </tbody> </table> <p><small>NOTE: The duty cycle applies to the entire transmission (not at each hopping channel).</small></p> <p>c) For FHSS transmissions with a dwell time less than 10 ms, a 0,1 % duty cycle restriction applies.</p> <p>d) Each hopping channel of the shall be occupied at least once during an epoch.</p> <p>e) The return time to a hop channel shall be less than or equal to the lower of an epoch or 20 seconds.</p> <p>f) The dwell time shall not exceed 400 ms.</p> <p>For 863 MHz to 870 MHz FHSS equipment. The Maximum occupied bandwidth per hopping channel shall be less or equal to 100kHz.</p>	Operational frequency band	Number of hop channels	Maximum occupied bandwidth per hopping channel	Specific requirements	865 MHz to 868 MHz	≥ 58	≤ 50 kHz	< 1 % TX duty cycle (see note)	863 MHz to 870 MHz	≥ 47	≤ 100 kHz	< 0,1 % TX duty cycle (see note)
Operational frequency band	Number of hop channels	Maximum occupied bandwidth per hopping channel	Specific requirements										
865 MHz to 868 MHz	≥ 58	≤ 50 kHz	< 1 % TX duty cycle (see note)										
863 MHz to 870 MHz	≥ 47	≤ 100 kHz	< 0,1 % TX duty cycle (see note)										
Test procedure:	Center frequency: The nominal operating frequency RBW=100kHz VBW>=3*RBW Trace detector: RMS Trace mode: Max hold												
Measurement Record:	Uncertainty: ± 1.5dB												
Test Instruments:	Refer to section 6.0 for details												
Test mode:	Refer to section 5.2 for details												
Test results:	Pass												

Measurement Data

Parameter	Manufacturer declared	Limit	Test Result
The number of hopping channels	47	≥47	Pass
The return time to a hop channel	2s	≤20s	Pass
Dwell time	100ms	≤400ms	Pass
The hop channel band width	100kHz	≤100kHz	Pass

Note: The above parameters have been declared by manufacturer.

7.2.11 TX Behaviour under Low-voltage Conditions

Test Requirement:	ETSI EN 300 220-2 Clause 4.3.8	
Test Method:	ETSI EN 300 220-1 Clause 5.12	
Receiver setup:	RBW=30Hz, VBW=100Hz, Detector= peak	
Limit:	Equipment Type	Limit
	channelized equipment	limits stated in clause 8.1.4
	non-channelized equipment	1>.within the assigned operating frequency band. And 2>.the radiated or conducted power is greater than the spurious emission limits
Test procedure:	<ol style="list-style-type: none"> 1. The carrier frequency shall be measured, where possible in the absence of modulation, with the transmitter connected to an artificial antenna. 2. A transmitter without a 50 Ω output connector may be placed in a test fixture connected to an artificial antenna. 3. The measurement shall be made under normal temperature and humidity conditions, 4. Transmitter shall power by a DC power source take place the original battery power source, the voltage from the test power source shall be reduced below the lower extreme test voltage limit towards zero. 5. Test the fundamental carrier frequency of the transmitter with nominal supply voltage 6. Whilst the voltage is reduced the carrier frequency shall be monitored. 7. transmitter shall be operated at the maximum rated carrier power level, under normal test conditions; 8. Record the woking frequency. 	
Measurement Record:	Uncertainty: $\pm 1 \times 10^{-7}$	
Test Instruments:	Refer to section 6.0 for details	
Test mode:	Refer to section 5.2 for details	
Test results:	Pass	

Measurement Data:

Voltage (AC)	Channel	Frequency spot (MHz)	Power (dBm)	Limit	Result
$V_{\text{normal}}=230\text{V}$	Lowest	863.1MHz	10.20	Within Operational Frequency Band 863 to 870 MHz	Pass
	Highest	869.9MHz	10.27		Pass
$V_{\text{extreme}}=100\text{V}$	Lowest	863.1MHz	10.21		Pass
	Highest	869.9MHz	10.26		Pass

Remarks:

1. The EUT is belong to non-channelized equipment.
2. V_{extreme} is the lowest operation voltage.

7.2.12 Transmit spurious emissions

Test Requirement:	ETSI EN 300 220-2 Clause 4.2.2		
Test Method:	ETSI EN 300 220-1 Clause 5.9		
Receiver setup:	Table 20: Parameters for TX Spurious Radiations Measurement		
	Operating Mode	Frequency Range	RBW_{REF} (see note 2)
	Transmit mode	$9 \text{ kHz} \leq f < 150 \text{ kHz}$	1 kHz
		$150 \text{ kHz} \leq f < 30 \text{ MHz}$	10 kHz
		$30 \text{ MHz} \leq f < f_c - m$	100 kHz
		$f_c - m \leq f < f_c - n$	10 kHz
		$f_c - n \leq f < f_c - p$	1 kHz
		$f_c + p < f \leq f_c + n$	1 kHz
		$f_c + n < f \leq f_c + m$	10 kHz
		$f_c + m < f \leq 1 \text{ GHz}$	100 kHz
		$1 \text{ GHz} < f \leq 6 \text{ GHz}$	1 MHz
	<p>NOTE 1: f is the measurement frequency. f_c is the Operating Frequency. m is 10 x OCW or 500 kHz, whichever is the greater. n is 4 x OCW or 100 kHz, whichever is the greater. p is 2,5 x OCW.</p> <p>NOTE 2: If the value of RBW used for measurement is different from RBW_{REF}, use bandwidth correction from clause 4.3.10.1.</p>		
Test Frequency range:	25MHz to 6GHz		
Limit:	Frequency	Limit(operation)	Limit(standby)
	47 MHz to 74 MHz 87.5 MHz to 118 MHz 174 MHz to 230 MHz 470 MHz to 790 MHz	4nW(-54dBm)	2nW(-57dBm)
	Other frequencies below 1000 MHz	250nW(-36dBm)	2nW(-57dBm)
	Above 1000 MHz	1uW(-30dBm)	20nW(-47dBm)
Test setup:	Below 1GHz		
	Above 1GHz		
Test procedure:	Substitution method was performed to determine the actual ERP emission levels of the EUT.		

	<p>The following test procedure as below:</p> <p>Below 1GHz:</p> <ol style="list-style-type: none"> 1. On the test site as test setup graph above, the EUT shall be placed at the 1.5m support on the turntable and in the position closest to normal use as declared by the provider. 2. The test antenna shall be oriented initially for vertical polarization and shall be chosen to correspond to the frequency of the transmitter. The output of the test antenna shall be connected to the measuring receiver. 3. The transmitter shall be switched on, if possible, without modulation and the measuring receiver shall be tuned to the frequency of the transmitter under test. 4. The test antenna shall be raised and lowered from 1m to 4m until a maximum signal level is detected by the measuring receiver. Then the turntable should be rotated through 360° in the horizontal plane, until the maximum signal level is detected by the measuring receiver. 5. Repeat step 4 for test frequency with the test antenna polarized horizontally. 6. Remove the transmitter and replace it with a substitution antenna (the antenna should be half-wavelength for each frequency involved). The center of the substitution antenna should be approximately at the same location as the center of the transmitter. At the lower frequencies, where the substitution antenna is very long, this will be impossible to achieve when the antenna is polarized vertically. In such case the lower end of the antenna should be 0.3 m above the ground. 7. Feed the substitution antenna at the transmitter end with a signal generator connected to the antenna by means of a nonradiating cable. With the antennas at both ends vertically polarized, and with the signal generator tuned to a particular test frequency, raise and lower the test antenna to obtain a maximum reading at the spectrum analyzer. Adjust the level of the signal generator output until the previously recorded maximum reading for this set of conditions is obtained. This should be done carefully repeating the adjustment of the test antenna and generator output. 8. Repeat step 7 with both antennas horizontally polarized for each test frequency. 9. Calculate power in dBm into a reference ideal half-wave dipole antenna by reducing the readings obtained in steps 7 and 8 by the power loss in the cable between the generator and the antenna, and further corrected for the gain of the substitution antenna used relative to an ideal half-wave dipole antenna by the following formula: $\text{ERP(dBm)} = \text{Pg(dBm)} - \text{cable loss (dB)} + \text{antenna gain (dB)}$ where: Pg is the generator output power into the substitution antenna. <p>Above 1GHz: Different between above is the test site, change from Semi- Anechoic Chamber to fully Anechoic Chamber, and the test antenna do not need to raise from 1 to 4m, just test in 1.5m height.</p>
Measurement Record:	Uncertainty: ± 6dB

There were no emissions found above system measuring level (at least 10 dB below the limit)

7.3 Receiver Requirements

Receiver Classification, Table 1 of ETSI EN 300 220-1.		
Rx Class	Relevant Rx Clauses	Risk assessment of Rx performance
1	8.3, 8.4, 8.5, 8.6	Category 1 is a high performance level of receiver. In particular to be used where the operation of a SRD may have inherent safety of human life implications.
1.5	8.4, 8.6	Category 1.5 is an improved performance level of receiver category 2.
2		Category 2 is standard performance level of receiver.
3	8.4, 8.6	Category 3 is a low performance level of receiver. Manufacturers have to be aware that category 3 receivers are not able to work properly in case of coexistence with some services such as a mobile radio service in adjacent bands. The manufacturer shall provide another mean to overcome the weakness of the radio link or accept the failure.

NOTE: The receiver category should be stated in both the test report and in the user's manual for the equipment. Receiver category 3 will be withdrawn after December 31st, 2018.

The EUT (Receiver part) belong to Category 2 with no Polite spectrum access function.

7.3.1 Receiver sensitivity

Not applicable, since the test applied to Polite spectrum access equipment.

7.3.2 Clear Channel Assessment threshold

Not applicable, since the test applied to Polite spectrum access equipment.

7.3.3 Polite spectrum access timing parameters

Not applicable, since the test applied to Polite spectrum access equipment.

7.3.4 Adaptive Frequency Agility

Not applicable, since the test applied to AFA quipment.

7.3.5 Adjacent channel selectivity

Not applicable, since the test applied to Category 1 equipment.

7.3.6 Receiver saturation at Adjacent Channel

Not applicable, since the test applied to Category 1 equipment.

7.3.7 Spurious response rejection

Not applicable, since the test applied to Category 1 equipment.

7.3.8 Behaviour at high wanted signal level

Not applicable, since the test applied to Category 1 equipment.

7.3.9 Bi-Directional Operation Verification

Not applicable, since this product is not support Bi-Directional operation function.

7.3.10 Blocking

Test Requirement:	ETSI EN 300 220-2 Clause 4.4.2																																				
Test Method:	ETSI EN 300 220-1 clause 5.18

Test setup:	 <pre> graph LR A[Signal Generator A] --- C[Combiner] B[Signal Generator B] --- C C --- EUT[EUT] </pre>																																				
Test procedure:	<ol style="list-style-type: none"> Two signal generators A and B shall be connected to the receiver via a combining network to the receiver antennaconnector. Signal generator A shall be at the nominal frequency of the receiver, with normal modulation of the wanted signal. Signal generator B shall be unmodulated. Measurements shall be carried out at frequencies of the unwanted signal at approximately ± 2 MHz and ± 10 MHz, avoiding those frequencies at which spurious responses occur. Initially signal generator B shall be switched off and using signal generator A the level which still gives sufficient response shall be established, however, the level at the receiver input shall not be adjusted below the sensitivity limit given in clause 8.1.4. The output level of generator A shall then be increased by 3 dB. Signal generator B is then switched on and adjusted until the wanted criteria (see clause 8.1.1) is just exceeded. With signal generator B settings unchanged the power into the receiver is measured by replacing the receiver with a power meter or spectrum analyzer. This level shall be 																																				

	<p>recorded. Alternatively, equipment having a dedicated or integral antenna may use a radiated measurement setup. For this, a test site from clause A.1 shall be selected and the requirements from clauses A.2 and A.3 apply.</p> <p>6. Signal generators A and B together with a combiner shall be placed outside the anechoic chamber and a TX test antenna shall be placed with the EUT's antenna polarisation. The EUT shall be placed at the location of the turntable at the orientation of the most sensitive position. Generator A shall be set in order to reach the EUT sensitivity limit +3 dB.</p> <p>7. The procedure shall be the same as for the conducted measurement. Bloking is the difference between signal generator B and signal generator A levels.</p>
Test Instruments:	Refer to section 6.0 for details
Test mode:	Refer to section 5.2 for details
Test results:	Pass
